

1a.As a vanilla git power-user that has never seen GigggleGit before, I want to learn how it integrates with git so I can use it confidently

1b.As a team lead onboarding an experienced GigggleGit user, I want to help my team understand and use Gigglegit as quickly as possible, while keeping open communication.

2.Story:As a developer who wants to use GigggleGit, I want to make it more customizable to improve my coding experience and malluabliltiy of Gigglegit code

Task: Make GigggleGit customizable

Ticket1: Design more settings

Details: Make the settings which are able to implement different categories of memes through GigggleGit and have corresponding preferences

Ticket2: Implement custom optimization

Details: Create a menu which can use certain optimization techniques for processing and storing Gigglegit things

3. This is too vague to be a user story, because it doesn't say what you are trying to authenticate, what new machine your running, how this will help progress, or a concise goal of what will determine if this is done.

CodeChuckle is introducing a new diff tool: SnickerSync—why merge in silence when you can sync with a snicker? The PMs have a solid understanding of what it means to "sync with a snicker" and now they want to run some user studies. Your team has already created a vanilla interface capable of syncing with the base GiggleGit packages.

Complete the following tasks:

1. List one goal and one non-goal
2. Create two non-functional requirements. Here are suggestions of things to think about:
 - Who has access to what
 - PMs need to be able to maintain the different snickering concepts
 - A user study needs to have random assignments of users between control groups and variants
3. For each non-functional requirement, create two functional requirements (for a grand total of four functional requirements).

1a.Goal:make sure that SnickerSync provides an intuitive and humorous experience without compromising the accuracy of code comparisons.

1b.Non-Goal: Implement AI-generated meme responses for every single line of code change.

2a. Implement user roles that each have different access permissions

2b. Make only admins have certain privileges like overriding merge conflicts

3a. Develop an automated assignment system that distributes users evenly across test groups.

3b. Log and track user interactions within the SnickerSync tool for analysis while maintaining privacy compliance.
